

Parameters

Parameters are integral part of an item's description. New parameters can be added by clicking the little '+Add' in the upper left corner of the tab. Now either all mandatory entries can be filled in manually or by autocomplete.

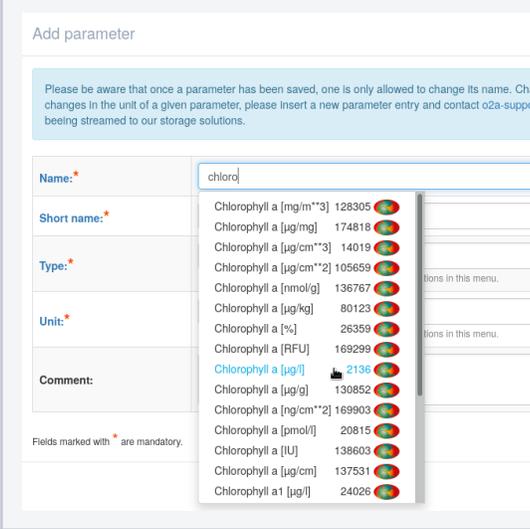

Manually a (long) name and a short name need be assigned. As for the whole item the shortname should be as unique as possible. This can be achieved by attaching an index to the parameter, a serial number or something else which appears feasible. Keep in mind that the short names cannot be modified, because once created they are in use within **ingest** and storage (for setting the path to data files for a particular item). Be also aware that you cannot create items with the same short name under one parent (e.g. you cannot have two **temperature** parameters at the same item, rather choose **temperature01** and **temperature02**) and **avoid capital letters**.

The field 'Type' refers to the parameter type (e.g. conductivity or cm/s). The unit of measurement must be set as well. Summaries of available types and units (as of 2021-06-16) are listed below.

When using **autocomplete** by punching in the first letters of the 'Name' field parameters from the stock of **pangaea.de** are offered to you by **registry.awi.de**. Especially the comment appears useful if data from O2A is propagated to **pangaea.de** for publishing. When using the autocomplete form only the parameter short name is left blank, because the user might want to choose a different one.

form to set up new parameters

suggestion of parameter entries from pangaea.de

Please consider adding properties (spaces.awi.de/x/2la0FQ) to a parameter (by clicking the  button) if applicable.

When in doubt or something is missing to your opinion, please send a support request to o2a-support@awi.de or ask the **chief editors of your project**.

soil_temperature	522	Soil temperature is the bulk temperature of the soil, not the surface (skin) temperature. Soil means the near-surface layer where plants sink their roots. For subsurface temperatures that extend beneath the soil layer or in areas where there is no surface soil layer, the standard name <code>solid_earth_subsurface_temperature</code> should be used.	04c49c fb- 2932- 4006- 9743- 170607 f98b47
solar_heat	73		36d4e3 f1- c696- 4065- bddf- b6d23c 13bb8a
solid_earth_sub surface_temper ature	523	The quantity with standard name <code>solid_earth_subsurface_temperature</code> is the temperature at any depth (or in a layer) of the solid earth, excluding surficial snow and ice (but not permafrost or soil). For temperatures in surface lying snow and ice, the more specific standard names <code>temperature_in_surface_snow</code> and <code>land_ice_temperature</code> should be used. For temperatures measured or modelled specifically in the soil layer (the near-surface layer where plants sink their roots) the standard name <code>soil_temperature</code> should be used.	d1a313 6b- 83bd- 414a- 9d50- 9cc5d0 29196c
